

AI-Generated Outfits for Indian Occasion Dressing

TL;DR | One-page summary

The Setup

Goal: Identify which AI image model best generates occasion-appropriate outfits for Indian contexts (wedding, festival, office) without defaulting to generic Western looks.

Models tested: OpenAI GPT Image 1, Google Gemini 2.5 Flash Image, Google Gemini 3.1 Flash-Lite Image.

Method: 5 occasions (wedding guest — woman/man, Diwali at home, corporate office wear, South Indian wedding guest) prompted identically across all 3 models. Outputs judged blind by 10 human raters via a custom web tool — scored 1–5 on 4 criteria, then a forced-choice pick — 53 total outfit judgments.

The Results

Model	Win rate
OpenAI GPT Image 1	77%
Google Gemini 3.1 Flash-Lite Image	13%
Google Gemini 2.5 Flash Image	9%

The Main Findings

GPT Image 1 is the clear preference: it won all 5 occasion categories outright, taking 77% of total judgments.

Component scores don't tell the whole story: per-criterion Likert ratings were close across all three models (3.2–3.8), but the forced-choice pick was lopsided — real preference lived in overall styling execution, not any single labeled trait.

One data hiccup worth flagging: the South Indian Wedding Guest category logged 13 judgments instead of 10, likely a duplicate submission — noted, not corrected, in the full report.

The Biggest Takeaway

GPT Image 1 is the outfit model to use today for an Indian styling feature — not because it scores highest on any single labeled quality, but because when raters had to actually choose, they picked it four times out of five.
